**SUBSTITUTED SPIRODIENES FOR THE  
TREATMENT OF INFLAMMATION**

**FIELD OF THE INVENTION**

5

This invention is in the field of antiinflammatory pharmaceutical agents and specifically relates to compounds, compositions and methods for treating inflammation and inflammation-associated 10 disorders, such as arthritis.

**BACKGROUND OF THE INVENTION**

Prostaglandins play a major role in the 15 inflammation process and the inhibition of prostaglandin production, especially production of PGG<sub>2</sub>, PGH<sub>2</sub> and PGE<sub>2</sub>, has been a common target of antiinflammatory drug discovery. However, common non-steroidal antiinflammatory 20 drugs (NSAIDs) that are active in reducing the prostaglandin-induced pain and swelling associated with the inflammation process are also active in affecting other prostaglandin-regulated processes not associated with the inflammation process. Thus, use of high doses of 25 most common NSAIDs can produce severe side effects, including life threatening ulcers, that limit their therapeutic potential. An alternative to NSAIDs is the use of corticosteroids, which have even more drastic side effects, especially when long term therapy is involved.

30 Previous NSAIDs have been found to prevent the production of prostaglandins by inhibiting enzymes in the human arachidonic acid/prostaglandin pathway, including the enzyme cyclooxygenase (COX). Recently, the sequence of a previously unknown enzyme in the human arachidonic 35 acid/prostaglandin pathway has been reported by T. Hla and K. Nielson, *Proc. Natl. Acad. Sci., USA*, 89, 7384 (1992) and named "cyclooxygenase II (COX II)" or "prostaglandin G/H synthase II." The discovery of an

inducible enzyme associated with inflammation provides a viable target of inhibition which more effectively reduces inflammation and produces fewer and less drastic side effects. Cyclooxygenase II is inducible by cytokines 5 or endotoxins and such induction is inhibited by glucocorticoids (J. Masferrer, et al, *Proc. Natl. Acad. Sci. USA*, **89**, 3917 (1992)). The 6-methoxy-2-naphthylacetic acid metabolite of nabumetone has been found by E. Meade et al to selectively inhibit the COX II enzyme (*J. Biol. Chem.*, **268**, 6610 (1993)). In addition, Futaki et al (*Prostaglandins*, **47**, 55 (1994)) have reported that N-(2-cyclohexyloxy-4-nitrophenyl)methanesulfonamide inhibits cyclooxygenase II and lacks gastric side effects.

15 The substituted spiro compounds disclosed herein selectively inhibit cyclooxygenase II over cyclooxygenase I and relieve the effects of inflammation. These compounds, in addition, do not display substantial inhibition of cyclooxygenase I and produce a reduced 20 amount of side effects.

Substituted spiro compounds are described in a copending application, Serial No. 08/194,762.

25 U.S. Patent No. 4,946,993 to Cortes, describes the use of aryl substituted cyclopentadienes to form N-phosphonomethylglycine.

30 Allen et al [*J. Org. Chem.*, **11**, 268 (1946)] describe the formation of 3,4-diphenylcyclopentadiene.

35 Zimmerman and Pinock [*J. Amer. Chem. Soc.*, **95**, 3246 (1973)] describe the synthesis of 5,5-dimethyl-2,3-diphenylcyclopentadiene from diacetylenic compounds.

Hirao et al [*J. Chem. Soc., Chem. Commun.*, 300 (1984)] describe the synthesis of norbornadienes from

substituted cyclopentadienes and acetylenes.

Specifically, 1,1'-(4,4-dimethyl-2,5-cyclopentadien-1,2-diy)bis[4-methoxybenzene] is described.

5 Hamer and Stubbs [J. Chem. Soc., D, 1013 (1970)] describe the formation of spiro[2,4]hepta-4,6-dienes through the photoisomerization of bicyclo[3,1,0]hex-2-enes. Specifically, 1,5,6-triphenyl-spiro[2,4]hepta-4,6-diene is described.

#### DESCRIPTION OF THE INVENTION

A class of substituted spiro compounds useful in treating inflammation-related disorders is defined by 15 Formula I:

20

wherein A is selected from

25

wherein each of R<sup>1</sup> through R<sup>10</sup> is independently selected from hydrido, halo, alkyl, alkoxy, alkylthio, cyano, haloalkyl, haloalkoxy, hydroxyalkyl, alkoxyalkyl, hydroxyl, mercapto, alkylsulfonyl, haloalkylsulfonyl and sulfamyl; and wherein n is a number selected from 0, 1, 2 and 3; or a pharmaceutically-acceptable salt thereof.

30

Compounds of Formula I would be useful for, but not limited to, the treatment of inflammation in a

subject, and for treatment of other inflammation-associated disorders, such as, as an analgesic in the treatment of pain and headaches, or as an antipyretic for the treatment of fever. For example, compounds of Formula 5 I would be useful to treat arthritis, including but not limited to rheumatoid arthritis, spondyloarthropathies, gouty arthritis, osteoarthritis, systemic lupus erythematosus and juvenile arthritis. Such compounds of Formula I would be useful in the treatment of asthma, 10 bronchitis, menstrual cramps, tendinitis, bursitis, and skin related conditions such as psoriasis, eczema, burns and dermatitis. Compounds of Formula I also would be useful to treat gastrointestinal conditions such as inflammatory bowel syndrome, Crohn's disease, gastritis, 15 irritable bowel syndrome and ulcerative colitis and for the prevention of colorectal cancer. Compounds of Formula I would be useful in treating inflammation in such diseases as vascular diseases, migraine headaches, periarteritis nodosa, thyroiditis, aplastic anemia, 20 Hodgkin's disease, sclerodoma, rheumatic fever, type I diabetes, myasthenia gravis, sarcoidosis, nephrotic syndrome, Behcet's syndrome, polymyositis, gingivitis, hypersensitivity, conjunctivitis, swelling occurring after injury, myocardial ischemia, and the like. The 25 compounds are useful as anti-inflammatory agents, such as for the treatment of arthritis, with the additional benefit of having significantly less harmful side effects.

30 The present invention also includes compounds which selectively inhibit cyclooxygenase II over cyclooxygenase I and do not significantly inhibit one or more other arachidonic pathway steps, such as thromboxane B<sub>2</sub> (TXB<sub>2</sub>) production. Importantly, thromboxanes cause 35 blood platelet aggregation and have vasoconstriction properties. Thus a lack of effect in the regulation of non-inflammation related thromboxane production is

further evidence of the beneficial selectivity of the present compounds.

Preferably, the compounds have a cyclooxygenase II IC<sub>50</sub> less than about 0.1 μM, and also have a selectivity ratio of cyclooxygenase II inhibition over cyclooxygenase I inhibition of at least 50, and more preferably of at least 100. Even more preferably, the compounds have a cyclooxygenase I IC<sub>50</sub> of greater than about 0.5 μM, and more preferably of greater than 5 μM. Such preferred selectivity may indicate an ability to reduce the incidence of common NSAID-induced side effects, such as ulcers.

A preferred class of compounds consists of those compounds of Formula I wherein each of R<sup>1</sup> through R<sup>10</sup> is independently selected from hydrido, halo, lower alkyl, lower alkoxy, lower alkylthio, cyano, lower haloalkyl, lower haloalkoxy, lower hydroxyalkyl, lower alkoxyalkyl, hydroxyl, mercapto, lower alkylsulfonyl, lower haloalkylsulfonyl and sulfamyl; or a pharmaceutically-acceptable salt thereof.

A class of compounds of particular interest consists of those compounds of Formula I wherein each of R<sup>1</sup> through R<sup>10</sup> is independently selected from hydrido, fluoro, chloro, bromo, iodo, methyl, ethyl, n-propyl, isopropyl, butyl, tert-butyl, isobutyl, methoxy, ethoxy, propoxy, butoxy, hydroxyl, mercapto, methylthio, ethylthio, cyano, fluoromethyl, difluoromethyl, trifluoromethyl, chloromethyl, dichloromethyl, trichloromethyl, pentafluoroethyl, heptafluoropropyl, difluorochloromethyl, dichlorofluoromethyl, difluoroethyl, difluoropropyl, dichloroethyl, dichloropropyl, trifluoromethoxy, hydroxymethyl, methoxymethyl, ethoxymethyl, methylsulfonyl, fluoromethylsulfonyl,

difluoromethylsulfonyl, trifluoromethylsulfonyl and sulfamyl; or a pharmaceutically-acceptable salt thereof.

 15 wherein n is a number selected from 0, 1, 2 and 3; or a pharmaceutically-acceptable salt thereof.

A preferred class of compounds consists of those compounds of Formula II wherein n is a number  
 20 selected from 0, 1 and 2; wherein each of R<sup>1</sup> through R<sup>10</sup> is independently selected from hydrido, halo, lower alkyl, lower alkylthio, cyano, lower haloalkyl, lower haloalkoxy, lower alkoxy, hydroxyl, mercapto, lower hydroxyalkyl, lower alkoxyalkyl, lower alkylsulfonyl, lower haloalkylsulfonyl and sulfamyl; or a pharmaceutically-acceptable salt thereof.

30 Where the term "alkyl" is used, either alone or within other terms such as "haloalkyl", "alkylsulfonyl", "alkoxyalkyl" and "hydroxyalkyl", embraces linear or branched radicals having one to about twenty carbon atoms or, preferably, one to about twelve carbon atoms. More  
35 preferred alkyl radicals are "lower alkyl" radicals having one to about ten carbon atoms. Most preferred are lower alkyl radicals having one to about six carbon

atoms. Examples of such radicals include methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl, sec-butyl, tert-butyl, pentyl, iso-amyl, hexyl and the like. The term "hydrido" denotes a single hydrogen atom (H). This 5 hydrido radical may be attached, for example, to an oxygen atom to form a hydroxyl radical or two hydrido radicals may be attached to a carbon atom to form a methylene (-CH<sub>2</sub>-) radical. The term "halo" means halogens such as fluorine, chlorine, bromine or iodine. The term 10 "haloalkyl" embraces radicals wherein any one or more of the alkyl carbon atoms is substituted with halo as defined above. Specifically embraced are monohaloalkyl, dihaloalkyl and polyhaloalkyl radicals. A monohaloalkyl radical, for one example, may have either an iodo, bromo, 15 chloro or fluoro atom within the radical. Dihalo and polyhaloalkyl radicals may have two or more of the same halo atoms or a combination of different halo radicals. The term "hydroxyalkyl" embraces linear or branched alkyl radicals having one to about twelve carbon atoms any one 20 of which may be substituted with one or more hydroxyl radicals. The terms "alkoxy" and "alkoxyalkyl" embrace linear or branched oxy-containing radicals each having alkyl portions of one to about twelve carbon atoms. More preferred alkoxy radicals are "lower alkoxy" radicals 25 having one to six carbon atoms. Examples of such radicals include methoxy, ethoxy, propoxy, butoxy and tert-butoxy. The term "alkoxyalkyl" also embraces alkyl radicals having two or more alkoxy radicals attached to the alkyl radical, that is, to form monoalkoxyalkyl and 30 dialkoxyalkyl radicals. The "alkoxy" or "alkoxyalkyl" radicals may be further substituted with one or more halo atoms, such as fluoro, chloro or bromo, to provide haloalkoxy or haloalkoxyalkyl radicals. The term "alkylthio" embraces radicals containing a linear or 35 branched alkyl radical, of one to about twelve carbon atoms attached to a divalent sulfur atom, such as a methythio radical, (CH<sub>3</sub>-S-). The term "sulfonyl", whether

used alone or linked to other terms such as alkylsulfonyl, denotes respectively divalent radicals  $-\text{SO}_2-$ . "Alkylsulfonyl" embraces alkyl radicals attached to a sulfonyl radical, where alkyl is defined as above.

5 The "alkylsulfonyl" radicals may be further substituted with one or more halo atoms, such as fluoro, chloro or bromo, to provide haloalkylsulfonyl radicals. The terms "sulfamyl" or "sulfonamidyl" denotes a sulfonyl radical substituted with an amine radical, forming a sulfonamide

10  $(-\text{SO}_2\text{NH}_2)$ .

#### GENERAL SYNTHETIC PROCEDURES

The compounds of the invention can be 30 synthesized according to the following procedures of Schemes I-XX, wherein the R<sup>1</sup>-R<sup>10</sup> substituents are as defined for Formula I, above, except where further noted.

Scheme I

Synthetic Scheme I shows the three step procedure used to prepare the bromoacetophenones 4 and the phenyl silyl enol ethers 5 from commercially available benzoic acids 1. In step one, a THF solution at 0°C of 5 the benzoic acids 1 and two equivalents of triethylamine are sequentially treated with isobutyl chloroformate and N-hydroxymethyl-N-methylamine hydrochloride to give the Weinreb amides 2 [see: S. Nahm and S. M. Weinreb, *Tetrahedron Lett.*, **21**, 3815 (1981)]. In step two, the 10 amides 2 are reacted with methylmagnesium bromide to give the corresponding acetophenones 3. In step three, the acetophenones 3 are either treated with bromine in acetic acid to give the corresponding bromoacetophenones 4 or chlorotrimethylsilane in acetonitrile in the presence of 15 triethylamine and sodium iodide to give the corresponding phenyl silyl enol ethers 5.

## Scheme II

### Example 1

25 **5-(4-Fluorophenyl)-6-[(methylsulfonyl)phenyl]spiro[2.4]hepta-4,6-diene**

**Step 1: Preparation of 4-(methylthio)acetophenone**

To a stirred solution of 50 g (340 mmol) of 4-(methylthio)benzonitrile in 2 L of THF at -78°C under an atmosphere of nitrogen was added 282 mL (390 mmol) of methylolithium (1.4 M in diethyl ether) over a period of

ten minutes. The solution was stirred at -78°C for one hour, and then the dry ice bath was removed. After five hours, 100 mL of water followed by 200 mL of 3N hydrochloric acid were added to the reaction mixture and 5 it was stirred overnight. Concentration in vacuo gave a residue which was partitioned between ethyl acetate and water. The water layer was extracted with three portions of ethyl acetate and the combined ethyl acetate layers were dried ( $\text{MgSO}_4$ ). Concentration in vacuo gave 58 g of 10 crude (4-methylthio)acetophenone as a solid: NMR ( $\text{CDCl}_3$ )  $\delta$  2.52 (s, 3H), 2.57 (s, 3H), 7.26 (d,  $J = 9$  Hz, 2H), 7.87 (d,  $J = 9$  Hz, 2H).

Step 2: Preparation of 4-(methylsulfonyl)acetophenone

15 To a solution of 11.73 g (71.1 mmol) of 4-(methylsulfonyl)acetophenone (prepared in Step 1) in 500 mL of dichloromethane at ambient temperature was added 61.14 g (177 mmol) of *m*-chloroperoxybenzoic acid (50%) 20 (MCPBA) in portions over 20 minutes. The reaction was stirred for two hours, quenched slowly with aqueous sodium bisulfite, washed with three 100 mL portions of saturated sodium bicarbonate, dried ( $\text{MgSO}_4$ ), and concentrated in vacuo to give 11.91 g (91%) of (4- 25 methylsulfonyl)acetophenone as a colorless solid: NMR ( $\text{CDCl}_3$ )  $\delta$  2.67 (s, 3H), 3.08 (s, 3H), 8.06 (d,  $J = 9$  Hz, 2H), 8.14 (d,  $J = 9$  Hz, 2H).

Step 3: Preparation of 2-bromo-4'-(methylsulfonyl)acetophenone

The

reaction mixture was diluted with 500 mL of water and extracted with chloroform. The combined extracts were dried ( $\text{MgSO}_4$ ) and concentrated in vacuo to give 15.7 g of crude 2-bromo-(4'-methylsulfonyl)acetophenone as a 5 solid: NMR ( $\text{CDCl}_3$ )  $\delta$  3.10 (s, 3H), 4.45 (s, 2H), 8.08 (d,  $J = 9$  Hz, 2H), 8.17 (d,  $J = 9$  Hz, 2H).

The reaction mixture was stirred for 30 minutes, concentrated in vacuo, and partitioned between ethyl acetate and water. The organic phase was dried ( $\text{MgSO}_4$ ) and concentrated in vacuo. Purification by silica gel 20 chromatography with ethyl acetate/hexane (1:1) gave 6.87 g (68%) of 2-(4-fluorophenyl)-1-[2-[4-(methylsulfonyl)phenyl]-2-oxoethoxy]ethanone as a colorless solid: NMR ( $\text{CDCl}_3$ )  $\delta$  3.08 (s, 3H), 3.79 (s, 2H), 5.35 (s, 2H), 7.06 (s, t,  $J = 9$  Hz, 2H), 7.32 (dd,  $J = 6$  and 9 Hz, 2H), 8.06 (s, 4H).

The reaction mixture was concentrated in vacuo and the residue partitioned

between dichloromethane and water. The dichloromethane layer was dried ( $\text{MgSO}_4$ ) and reconcentrated in vacuo. #### BIOLOGICAL EVALUATION

##### Rat Carrageenan Foot Pad Edema Test

The carrageenan foot edema test was performed with materials, reagents and procedures essentially as 10 described by Winter, et al. (Proc. Soc. Exp. Biol. Med., 111, 544 (1962)). Male Sprague-Dawley rats were selected in each group so that the average body weight was as close as possible. Rats were fasted with free access to water for over sixteen hours prior to the 15 test. The rats were dosed orally (1 mL) with compounds suspended in vehicle containing 0.5% methylcellulose and .025% surfactant, or with vehicle alone. One hour later a subplantar injection of 0.1 mL of 1% solution of carrageenan/sterile 0.9% saline was administered and the 20 volume of the injected foot was measured with a displacement plethysmometer connected to a pressure transducer with a digital indicator. Three hours after the injection of the carrageenan, the volume of the foot was again measured. The average foot swelling in a 25 group of drug-treated animals was compared with that of a group of placebo-treated animals and the percentage inhibition of edema was determined (Otterness and Bliven, Laboratory Models for Testing NSAIDs, in Non-steroidal Anti-Inflammatory Drugs, (J. Lombardino, ed. 30 1985)). Results are shown in Table I.

##### Rat Carrageenan-induced Analgesia Test

The rat carrageenan analgesia test was 35 performed with materials, reagents and procedures essentially as described by Hargreaves, et al. (Pain, 32, 77 (1988)). Male Sprague-Dawley rats were treated as

previously described for the Carrageenan Foot Pad Edema test. Three hours after the injection of the carrageenan, the rats were placed in a special plexiglass container with a transparent floor having a 5 high intensity lamp as a radiant heat source, positionable under the floor. After an initial twenty minute period, thermal stimulation was begun on either the injected foot or on the contralateral uninjected foot. A photoelectric cell turned off the lamp and timer 10 when light was interrupted by paw withdrawal. The time until the rat withdraws its foot was then measured. The withdrawal latency in seconds was determined for the control and drug-treated groups, and percent inhibition of the hyperalgesic foot withdrawal determined. Results 15 are shown in Table I.

Evaluation of COX I and COX II activity *in vitro*

30 The compounds of this invention exhibited inhibition *in vitro* of COX II. The COX II inhibition activity of the compounds of this invention illustrated in the Examples was determined by the following methods.

a. Preparation of recombinant COX baculoviruses

35

A 2.0 kb fragment containing the coding region of either human or murine COX-I or human or murine COX-

II was cloned into a BamH1 site of the baculovirus transfer vector pVL1393 (Invitrogen) to generate the baculovirus transfer vectors for COX-I and COX-II in a manner similar to the method of D.R. O'Reilly et al

5     *(Baculovirus Expression Vectors: A Laboratory Manual (1992))*. Recombinant baculoviruses were isolated by transfecting 4 µg of baculovirus transfer vector DNA into SF9 insect cells (2x10e8) along with 200 ng of linearized baculovirus plasmid DNA by the calcium

10    phosphate method. See M.D. Summers and G.E. Smith, *A Manual of Methods for Baculovirus Vectors and Insect Cell Culture Procedures*. Texas Agric. Exp. Station Bull. 1555 (1987). Recombinant viruses were purified by three rounds of plaque purification and high titer (10E7 - 10E8 pfu/ml) stocks of virus were prepared. For large

15    scale production, SF9 insect cells were infected in 10 liter fermentors (0.5 x 10<sup>6</sup>/ml) with the recombinant baculovirus stock such that the multiplicity of infection was 0.1. After 72 hours the cells were

20    centrifuged and the cell pellet homogenized in Tris/Sucrose (50 mM: 25%, pH 8.0) containing 1% 3-[(3-cholamidopropyl)dimethylammonio]-1-propanesulfonate (CHAPS). The homogenate was centrifuged at 10,000xG for 30 minutes, and the resultant supernatant was stored at

25    -80°C before being assayed for COX activity.

b. Assay for COX I and COX II activity:

COX activity was assayed as PGE<sub>2</sub> formed/µg protein/time using an ELISA to detect the prostaglandin released. CHAPS-solubilized insect cell membranes containing the appropriate COX enzyme were incubated in a potassium phosphate buffer (50 mM, pH 8.0) containing epinephrine, phenol, and heme with the addition of arachidonic acid (10 µM). Compounds were pre-incubated with the enzyme for 10-20 minutes prior to the addition of arachidonic acid. Any reaction between the

arachidonic acid and the enzyme was stopped after ten minutes at 37°C/room temperature by transferring 40  $\mu$ l of reaction mix into 160  $\mu$ l ELISA buffer and 25  $\mu$ M indomethacin. The PGE<sub>2</sub> formed was measured by standard 5 ELISA technology (Cayman Chemical). Results are shown in Table II.
